

# Year 6 – Balancing Act

## Teacher Guide and Unit Plan

### Learning Intentions

We are learning ...

... to describe physical habitat conditions explain how these conditions affect survival.

... to describe how human behaviour impacts the survival of a species.

... how humans can have a positive impact on the physical conditions of the habitat of a species.

### Success Criteria

We will be successful when...

... we list the physical conditions of a habitat that affect a species survival and describe how Swift Parrots have been affected.

...we describe at least 3 physical conditions including one cause–effect link to survival.

...we communicate the positive impacts humans have had to support the survival of a species through infographics and real world examples.

### Australian Curriculum

#### Learning Area Content Descriptions

#### Science

AC9S6U01 investigate the physical conditions of a habitat and analyse how the growth and survival of living things is affected by changing physical conditions

#### Science as a human endeavour

AC9S6H02 investigate how scientific knowledge is used by individuals and communities to identify problems, consider responses and make decisions

#### Science Inquiry

Questioning and Predicting AC9S6I01 pose investigable questions to identify patterns and test relationships and make reasoned predictions

Planning and Conducting AC9S6I03 use equipment to observe, measure and record data with reasonable precision, using digital tools as appropriate

Processing, modelling and Analysing AC9S6I04 construct and use appropriate representations, including tables, graphs and visual or physical models, to organise and process data and information and describe patterns, trends and relationships

Evaluating AC9S6I05 compare methods and findings with those of others, recognise possible sources of error, pose questions for further investigation and select evidence to draw reasoned conclusions

Communicating AC9S6I06 write and create texts to communicate ideas and findings for specific purposes and audiences, including selection of language features, using digital tools as appropriate

**Cross-Curriculum Priorities** Sustainability

**General Capabilities** Literacy, Digital Literacy, Critical and Creative Thinking

### Achievement standard

By the end of Year 6 students explain how changes in physical conditions affect living things. They describe how individuals and communities use scientific knowledge.

They select and use language features effectively for their purpose and audience when communicating their ideas and findings.

## Teacher Background Information

### Teacher Notes — Year 6 “Habitats, Change & Conservation” (≤500 words)

#### What “cause and effect” means (for students).

Use “cause → effect” as a clear chain: a change in a **physical condition** (e.g., loss of nesting hollows) leads to a **biological outcome** (lower breeding success). This aligns with curriculum glossaries (English/Science) that emphasise causal links in explanations and arguments.

Humans can **restore**, **protect**, and **enhance** the physical conditions of habitats so animals have the food, shelter, water, and space they need to survive. These actions directly improve temperature regulation, vegetation structure, nesting opportunities, water quality, and ecosystem resilience.

#### Habitat Restoration (Re-establishing physical conditions)

Large-scale replanting and ecological restoration projects rebuild habitats that were previously degraded.

- Reforestation and wetland restoration globally help **reduce soil erosion**, improve **water quality**, and rebuild ecosystems damaged by climate change or land clearing.

#### Captive Breeding and Reintroduction

Captive breeding programs improve population stability and allow species to be reintroduced into improved habitats.

- Hobart Zoo and Aquarium participate in breeding programs for the Swift Parrot and Tasmanian Devil.
- Reintroduction efforts demonstrate that restoring physical habitat conditions followed by release programs can reverse declines like in Tasmanian with the spotted handfish.

#### Science-Led Monitoring and Environmental Planning

Monitoring helps governments and conservation teams understand what physical conditions need restoration.

- The Swift Parrot Recovery Project uses long-term monitoring to guide habitat protection and understand flowering patterns and nesting conditions.
- Land-use planning and conservation strategies regulate where development can occur to prevent further habitat damage.

#### Community Education and Conservation Strategies

Education programs in zoos and aquariums, like the daily keeper talks and animals encounters at Hobart Zoo and Aquarium, empower communities to participate in conservation, support habitat improvement, and protect sustainable ecosystems.

## Year 6 Unit Plan – Balancing Act

	Tuning In	Modelling – I do	Guided Practice- We do	Independent Practice– You do	Plenary	Resources
<b>Lesson 1 – How does the physical condition of a habitat affect a species survival?</b>						
<b>Learning Intention</b>	We are learning to describe physical habitat conditions explain how these conditions affect survival.		<b>Success Criteria</b>		We will be successful when we list the physical conditions of a habitat that affect a species survival and describe how Swift Parrots have been affected.	
<b>Sequence</b>	<p><b>KWL</b> How does the physical condition of a species habitat affect it's survival?</p> <p>Model how to record what you know and what you'd like to know to answer the inquiry question.</p> <p>Show students Slide 7 with photos of the Swift Parrot Habitat to give them ideas.</p>	<p><b>Read the text – Physical Habitat Conditions</b></p> <p>Model how to highlight key facts that explain what physical conditions are.</p>	<p>Students to work in pairs to highlight physical conditions that are affecting the swift parrot.</p> <p>Pose the question: What is the impact of humans on their habitat? Students to highlight examples from the text.</p>	<p>Students to complete the Swift Parrot profile and table.</p> <p>This is leading into the concept of cause and effect for Lesson 2.</p>	<p>Complete the final column of the KWL Chart.</p> <p>Class discussion: How can humans impact the physical conditions of a species habitat?</p> <p>How can you describe these impacts? Prompting for students to understand that humans have a positive and negative impact on habitats.</p>	<p>Reading – Physical Habitat Conditions</p> <p>Swift Parrot Profile</p> <p>Optional – Suzi P the Swift Parrot picture book which highlights the human impact on Swift Parrots on Bruny Island.</p>

## Adjustments

The following adjustments are differentiated to support and engage all students.

	Enabling	Extending
Content	Provide simplified readings, key vocabulary explanations, and scaffolded fact sheets to reduce cognitive load and support understanding of core ideas such as habitat needs and cause-effect relationships.	Provide complex texts, multiple species case comparisons, and opportunities to analyse scientific data sets and environmental trends
Process	Use structured graphic organisers, guided group work, modelling, and step-by-step tasks that break down research and writing into manageable stages.	Encourage independent inquiry, evaluation of conservation strategies, interpretation of population graphs or maps, and cross-disciplinary problem-solving.
Product	Allow students to demonstrate understanding through posters, labelled diagrams, short oral recordings, or supported templates for written work.	Require multi-section analytical reports, detailed conservation proposals, comparative evaluations of programs, or the design of new monitoring or citizen-science initiatives.

# Physical Habitat Conditions

Animals can only survive if the physical conditions in their habitat meet their needs, such as food, shelter and safety. For example, Swift Parrots need old blue gum trees that produce nectar and have hollows for nesting, but scientists have found that more than half of their breeding habitat has been destroyed or damaged, which means there are fewer places for them to live and feed. They are also preyed upon by nocturnal animals such as sugar gliders and owls.

Figure 1- Swift Parrot nesting in a blue gum hollow.

Humans help to improve the physical conditions of the swift parrot by planting 1,600 trees (Department of Natural Resources Tasmania) and installing nesting boxes on established trees. Blue gums are found on Bruny Island. Here humans have installed nesting boxes high up in trees. The

boxes have mechanisms that automatically close at night and open in the morning so that Swift Parrots are protected from nocturnal predators.

Humans have also helped protect their habitat through the work of the Tasmanian Government where they have protected 260 hectares of breeding ground.

Figure 2- Nesting box.

## Year 6 - Impact of Human Behaviour on Animal Habitats

**Conservation** (*noun*) — protecting and caring for the natural environment so living things can survive into the future.

Conservation helps Australian animals stay safe in healthy habitats.

Humans can affect animals in many ways. Some actions harm wildlife, like land clearing and habitat destruction. A famous example is the Thylacine (Tasmanian Tiger). It became extinct in 1936 after heavy hunting, habitat loss which forced them to hunt for prey on farms and closer to towns. In the late 1800s, a government bounty paid people to kill thylacines causing all of them to disappear and render the species extinct.

Changes in physical conditions also affect living things. When temperature and rainfall shift, animals may struggle to find food, stay healthy, or raise young. Education resources from World Wildlife Fund show how climate and environmental changes can shape animal growth, movement, and behaviour, and why conservation is needed to protect species and habitats.

Figure 3- Thylacine

Figure 4 - Wombat burrow flap.

There are positive stories too. In Tasmania, bare-nosed wombats can get sarcoptic mange, a painful skin disease caused by mites. The Tasmanian Government, the University of Tasmania, and community groups are working on safe ways to treat wild wombats, including field-tested methods that apply approved medicines such as fluralaner to protect them from mange. Simple walk-through treatment stations (set up on wombat paths) let wombats receive a measured dose as they pass by, helping reduce

outbreaks and improve welfare.

These examples show how human behaviour matters. Harmful choices can push species towards extinction, as happened to the Thylacine. But strong conservation actions—like protecting habitats and treating disease in wild animals—help species such as wombats survive and thrive.
